

The Great Global Warming Swindle [\(Video\)](#)

Greatglobalwarmingswindle.com

A DVD of the film, **The Great Global Warming Swindle** is now available [\(Amazon\)](#) despite the strenuous efforts of those who support the theory of global warming to prevent its release).

The DVD is an expanded and improved version of the above documentary broadcast in the UK on Channel Four. More interview material has been added, covering a broader range of subjects than was possible in the broadcast film.

However, we urge those interested in hearing the case against the theory of man made global warming to dig deeper. The main purpose of this site is to point people towards key scientific papers, books and other relevant material.

We have received literally thousands of emails from scientists and others expressing their support and encouragement. These emails are also often very useful, steering us towards new studies in different areas. Please keep sending them.

The email address is: gw@wagtv.com

The general reaction to the film has been overwhelming and enormously encouraging. As Channel Four reported in Broadcast magazine, they received a record number of phone calls following the first transmission. They calculated that the calls were 6 to 1 in support of the film.

It would be nice to claim that the explosion of interest was due to the film itself, but the fuss started even before the film was broadcast. The reason, we suspect, is that the coverage of 'global warming', on TV, radio and in the press, has been so one-sided and uncritical. In Britain, hours and hours of programmes have been broadcast by the BBC on the subject, much of it scientifically absurd. The very fact that a science documentary dared to challenge the orthodoxy was itself news.

Why? Why have journalists been so craven or biased? How has a theory which demonstrably lacks really solid supporting evidence become an indisputable fact? What of the impressive, much talked about scientific 'consensus' which is used to forestall any awkward questions about the evidence?

The film made a humble stab at suggesting some possible answers, but there was limited space for these bigger questions. The whole global warming alarm, we believe, raises serious issues about the way science functions in the real world, about the political bias of scientists, about censorship within the scientific community itself, about the routine practice of scientists drawing false or inflated conclusions from ambiguous or uncertain data, about the manifest failure of the peer review process, about the extraordinary unwillingness of scientists who have invested time and reputation in a particular theory to consider evidence which directly contradicts it, about the elevation of speculation (models) to the level of solid data, and much else besides.

Science and scientists cannot always rise above the prejudices of their class and of their age. The selection and handling of evidence often reflects these prejudices. The most highly qualified and respected scientists can be blind to obvious deficiencies in a theory, and will be dismissive of evidence when it undermines what they want to believe.

But the scare over man made global warming may prove to be the first great example in the modern Western world, when science was betrayed by scientists themselves

This web-site is still young, and the people running it are doing so in their spare time (when they really should be making television programmes). So apologies for its shortcomings. The makers of the documentary The Great Global Warming Swindle have made many science documentaries before. The thing they found most shocking when they started to make this one, was the weakness of the case for man made global warming, and the quantity and quality of the evidence which flatly contradicts it.
